

Revision :-

list → multiple things

↳ same data

↳ Different data types

$\begin{matrix} 42 \\ 2.1 \end{matrix} \rightarrow$ Same data type

Indexing:-

list = ["Milk", "Orange", "Chocolates", "Maggie"]

Index →

0

1

2

3

print(list[1])

Quiz: print(list[3])

a) Milk

b) Orange

c) Chocolates

d) Maggie ✓

Excellent

List Methods:-

list =

Milk	Chocolates	Maggie	Orange
------	------------	--------	--------

append → adding in a list

Methods:

1) append → Adds the element at of the list

```
list=['Milk','Chocolate','Maggie']  
print(list) # Output : ['Milk', 'Chocolate', 'Maggie']  
  
# 1. append --> Adds the element at the end of the list  
list.append('Orange')  
print(list) # Output : ['Milk', 'Chocolate', 'Maggie', 'Orange']  
  
list.append('Grapes')  
print(list) # Output : ['Milk', 'Chocolate', 'Maggie', 'Orange', 'Grapes']
```

2) len → It will finds out total no. of elements

```
name=['S','H','A','U','R','Y','A']  
  
print(len(name)) #Output : 7
```

3) extends → It add the multiple elements at once.

```
name.extend(['Azaan',24,70.45,True])  
print(name)
```

4) count → It counts how many times a elements appears

```
marks = [12, 13, 8, 9, 17,13, 13, 8]  
print(marks.count(13)) #Output : 3
```

5) index → Index method will give you first index when element appears.

```
print(marks.index(13)) #Output : 1
```

5) reverse → It reverses the order of element.

5) *reverse* → It reverses the order of element.

$[1, 2, 3] \xrightarrow{\text{reverse}} [3, 2, 1]$

```
numbers=[1,2,3,4]
numbers.reverse()
print(numbers)
```

6) *pop* → It removes the last of list

$[5 \ 4 \ 3 \ (12)] \xrightarrow{\text{pop}} [5 \ 4 \ 3]$
